

MeBy2 — Knowledge Management Framework

Summary

This document describes the KM process, note types, and templates used in the MeBy2 personal knowledge vault. It is intended to be shared with another AI as context for building a knowledge base solution using the same methodology.

Philosophy

MeBy2 is an **outcome-focused, evidence-based, relational knowledge system**. It captures not just what was done, but why, with whom, and what was learned. It is designed for a knowledge worker managing complex, multi-stakeholder initiatives across an organization.

Core principles: - Every piece of knowledge links to related entities (people, projects, areas) - Evidence and learning are captured as time-stamped reflections, not static notes - Tasks and meetings are tagged inline and aggregated dynamically via queries - Minimal metadata overhead: just `parent` , `tags` , and `date`

Entity Types

The system has **5 note types**, each serving a distinct purpose:

#	Type	Folder	Purpose
0	Journal	0-Journal/	Daily capture of work, meetings, decisions, tasks
1	Project	1-Projects/	Temporary initiatives with specific goals and success criteria
2	Area	2-Areas/	Ongoing responsibilities (no end date)
3	Resource	3-Resources/	Reference material, frameworks, external knowledge
5	Person	5-People/	Contacts and relationship notes

Templates

1. Project Note

Projects represent time-bounded initiatives with clear goals, members, and a reflective timeline of decisions.

```
---
parent: "[[0-Projects]]"
tags:
  - "#projects/project-name"
date: YYYY-MM-DD
---

## Overview

[1-2 sentence description of the initiative's purpose and scope.]
```

Goals

- [Specific, measurable outcome or success criterion]
- [Supporting detail or evidence link]
- [Another goal]

Members

[[PersonName]], [[PersonName2]]

References

- * [Link to supporting document, SharePoint, presentation, etc.]
- * [[Related Resource Note]]

Reflections

- * YYYY-MM-DD
 - [Key decision or insight from this date]
 - [What was learned, what changed, what was decided]
 - [[Link to related project or area if relevant]]
- * YYYY-MM-DD
 - [Next timeline entry]

Areas to address

- * [Emerging challenge or opportunity discovered during the project]
- * [[Link to related project or area]]

Meetings

(query: block:(#meeting #projects/project-name))

Pending discussions

(tasks query: not done | sort by priority | tag includes #projects/project-name | tag in

Tasks

(tasks query: not done | sort by priority | tag includes #projects/project-name | tag d

2. Area Note

Areas represent ongoing responsibilities with no defined end date. They track direction, reflections, and open tasks.

```
---
parent: "[[0-Areas]]"
tags:
  - "#areas/area-name"
date: YYYY-MM-DD
---

## Overview
[Description of this ongoing responsibility domain and its purpose.]

## Reflections
* [Insight, preference, or strategic direction note]
* [[Link to a related project or decision]]

## Meetings
(query: block:(#meeting #areas/area-name))

## Tasks
(tasks query: not done | sort by priority | tag includes #areas/area-name)
```

3. Journal Entry

Journal entries are daily captures. They are the primary place where work is recorded, evidence is generated, and links to all other entity types are created.

```
## Focus for the day
* [Priority 1]
```

```

* [Priority 2]

## Other tasks to do
* [Supporting work]

## Meetings and interactions
- [Meeting title] [[PersonName]] #meeting #projects/project-name
  - [Key point discussed]
  - [Decision made]
  - [ ] [Follow-up task] #projects/project-name 📌 📅 YYYY-MM-DD

- [Email/async] [[PersonName]] #areas/area-name
  - [Summary]
  - [Next steps]

## Deep work and tasks
* [Project or area section]
  - [x] [Completed task] #projects/project-name 📌 ✅ YYYY-MM-DD
  - [Brief note on what was done or learned]

## Parking lot
[Issues, ideas, or topics to revisit later]

## Reminders for today
[Time-sensitive items]

## Task list
(tasks query: not done | tag does not include #discussion | sort by priority)

```

Task metadata format (inline, within any section):

- [] Task description #tag 📌 📅 YYYY-MM-DD
- [x] Completed task #tag 📌 ✅ YYYY-MM-DD

Priority emojis: 🚩 urgent · 🟡 high · 🟠 low Status: [] open · [x] done · ⌚ scheduled · ✅ completed with date

4. Person Note

People notes are intentionally lightweight. They serve as reference nodes for linking and relationship tracking.

```
---
parent: "[[0-People]]"
tags:
  - "#person"
  - "#person/person-slug-name"
date: "YYYY-MM-DD"
---

## Reflections
* [Role or context: what this person does, their org, their relationship to your work]
* e.g., "Leading [[Infrastructure Division]]"
* e.g., "Key stakeholder in [[0-Billing]]"

## Discussions
(tasks query: not done | tag includes #person/person-slug-name)
```

5. Resource Note

Resources are the most flexible format. They capture external knowledge, frameworks, definitions, and reference material.

```
#resources/category

* [Key fact, definition, or concept]
```

- * [Another relevant point]
- * [[Link to related project or area]]

[May include longer-form content: methodology descriptions, structured frameworks, interview findings, organizational references, process documentation, etc.]

Resources do not require frontmatter. Their tag at the top is sufficient for linking.

How Evidence Flows Through the System

Evidence is not stored in a single place — it accumulates across note types and flows through the system via links and tags.

Flow pattern:

```
Resource (framework or external context)
↓
Project (goals + success criteria defined upfront)
↓
Journal entries (daily capture of meetings, decisions, work done)
↓
Tasks (specific actions, tagged with project + priority)
↓
Meeting notes (inline in journal – attendees, decisions, outcomes)
↓
People tags (who was involved in what)
↓
Project Reflections (time-stamped synthesis of what was learned)
↓
Areas to address (emerging challenges or opportunities surfaced)
↓
Area notes (ongoing impact on responsibilities)
```

Where evidence appears:

Location	What it captures
Project → Goals	Success criteria defined upfront
Project → Reflections	Time-stamped decisions, insights, stakeholder feedback
Project → Areas to address	Challenges and opportunities discovered during execution
Journal → Meetings and interactions	Real-time decisions and outcomes from conversations
Journal → Deep work	Completed tasks and notes on what was done
Tasks	Completion records with dates ( YYYY-MM-DD)
Separate resource notes	Interview findings, structured feedback, research results

Example (Billing project):

1. **Resource:** "Deliver a Value Story" methodology is referenced
 2. **Project:** Goals defined — identify business capabilities, get stakeholder buy-in
 3. **Journal entries:** Meetings with Magdalena, research logged with outcomes
 4. **Tasks:** "Call for meeting with Magdalena" → completed with date
 5. **People:** Magdalena's person note linked in discussions
 6. **Reflections:** 2025-04-30, 2025-06-18, 2025-07-22 — decisions and emerging use cases documented
 7. **Areas to address:** Leadership skills, IT execution gaps — discovered during project
-

Tagging Convention

Tags use a consistent hierarchical namespace:

Tag pattern	Used for
<code>#projects/project-name</code>	All notes, tasks, and meetings related to a project
<code>#areas/area-name</code>	All notes and tasks related to an ongoing area
<code>#person/person-slug</code>	Discussion tasks for a specific person
<code>#meeting</code>	Meeting notes in journal entries
<code>#discussion</code>	Topics to raise (separate from action tasks)
<code>#resources</code> or <code>#resources/category</code>	Resource notes

Tag slugs use lowercase and underscores: `#projects/ai_task_force` , `#person/rolf_waaler`

Linking Convention

Wiki-style double-bracket links `[[EntityName]]` connect entities bidirectionally:

- `[[PersonName]]` — links to a person note
- `[[0-Projects]]` — links to the project index
- `[[0-Billing]]` — links to a specific project
- `[[Resource Name]]` — links to a resource note
- `[[Organizational Unit]]` — links to an org-level resource

Links are bidirectional: referencing `[[Victor]]` from a project makes that project findable from Victor's note via backlinks.

Index Notes (Hub Pattern)

Each entity type has a `0-` prefixed index note that serves as a hub:

- `0-Journal/` — chronological folders by year/month
 - `1-Projects/0-Projects.md` — lists all projects
 - `2-Areas/0-Areas.md` — lists all areas
 - `3-Resources/` — no single index, browsed directly
 - `5-People/0-People.md` — lists all people
-

Deliverable

Task: Export this document as a PDF file at `/home/user/MeBy2/MeBy2-KM-Framework.pdf`

Method: Use `pandoc` to convert this markdown plan file to PDF.

Command:

```
pandoc /root/.claude/plans/happy-sleeping-cloud.md \  
-o /home/user/MeBy2/MeBy2-KM-Framework.pdf \  
--pdf-engine=xelatex \  
-V geometry:margin=2cm \  
-V fontsize=11pt \  
--highlight-style=tango
```

Fallback (if xelatex unavailable): use `wkhtmltopdf` or `weasyprint` via HTML intermediate.
